Novel antibody or its antigen binding fragment that specifically binds to monocyte chemotactic protein-2 and other beta-chemokine, useful for detecting presence of beta-chemokine in sample, and blocking chemotaxis.

Example 8; Page 66; 100pp; English.

The invention relates to an antibody or its antigen binding fragment (AF) that specifically binds to a plurality of beta-chemokines, particularly monocyte chemotactic proteins MCP-1, MCP-2 and MCP-3. The antibodies are useful in an immunoassay method for detecting the presence of a beta-chemokine in a sample, and for blocking chemotaxis. The antibodies or their AFs are useful for treating a subject suffering from a disorder

The antibodies are also useful for treating oncogenic disease or cancer, Crohn's disease, diabetic nephropathy, cachexia, stroke, ulcerative colitis, coronary restenosis, Huntington's disease and Parkinson's disease. The present sequence represents a murine monoclonal antibody (MAb) IAI heavy chain variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-SEP-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 122 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc members of the beta-chemokine family (of which MCP-1, MCP-2 and MCP-3 CC belong) and in particular antibodies that have been modelled on, and CC modified from, the variable complementarity determining regions (CDRs) of CC describes using these antibodies to treat or prevent diseases and CC disorders including glomerulonephritis, scleroderma, cirrhosis, multiple CC sclerosis, lupus nephritis, atherosclerosis inflammatory bowel diseases, created arthritis, inflammatory diseases, fibrotic disorders, cancer CC and immunopathological disorders. Accordingly, they can be used in the CC antiarteriosclerotic, antiarthritic, antiinflammatory, antirhemmatic, CC cytostatic dermatclogical, hepatotropic, immunomodulator, nephrotropic and neuroprotective activities. This polypeptide sequence is the murine CC cond in the activities. This polypeptide sequence is the murine CC cond in the condition of the invention.

Specifically, it refers to humanised antibodies that bind to members of the beta-chemokine family (of which MCP-1, MCP-2 and MCP-3 belong) and in particular antibodies that have been modelled on, and modified from, the variable complementarity determining regions (CDRs) of the murine 11K2 and 1Al immunoglobulin sequences. The present invention describes using these antibodies to treat or prevent diseases and disorders including glomerulonephritis, screenederma, cirrhosis, multiple sclerosis, lupus nephritis, atherosclerosis, inflammatory bowel diseases, rhound arthritis, inflammatory diseases, fibrotic disorders, cancer and immunopathological disorders. Accordingly, they can be used in the development of pharmaceutical compositions that exhibit
                                                                                                                                                                                                                                                                       regulatory domain; p53 mutant; H273; W248; G281; p53-dependent trans-activating activity; restoration; tumour-suppressing activity; tumour cell; treatment;

The antibody binds to an epitope present in the C-terminal region of the p53 protein that includes onligomerisation and regulatory domains, specifically between positions 320 and 393. ScFv 421 is directed against p53 mutants, particularly H273, W248 and G281 mutants. When the ScFV is introduced into cells containing a mutant p53 protein, p53-dependent trans-activating activity is restored. ScFV 421 is specific for p53-mutants that have lost tumour-suppressing activity and are present in tumour cells. It is particularly used to treat hyper-proliferation associated with these mutants (e.g. cancer and re-stenosis) but may also be used in vitro for studying mechanisms of activity of p53 or its mutant and to purify or detect p53

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents the heavy chain variable region for monoclonal antibody (MAD) 14011, which immunoreacts with a lead cation. The sequence was derived from RNA isolated from mouse hybridoma cells. It can be used for binding heavy metals, such as lead cations. It can be used for detecting, removing, adding or neutralising the heavy aqueous liquid systems, in biological or environmental systems or in such compositions as perfumes, cosmetics, pharmaceuticals, health care products, skin treatment products, pesticides, herbicides, solvents used in the production of semi-conductor and integrated circuit components and production materials for electronic components. The products can provide for applications involving minute amounts of specific heavy metals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neavy

The present sequence is a heavy chain variable region of monoclonal antibody PAb-421 which is specific to the C-terminal DNA-binding domain of murine p53 protein. PAb-421 antibody and peptides based on complementarity determining regions of light and heavy chain variable regions of the antibody, are examples of active compounds useful in the diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                      25-NOV-1997

The mutants preferably also have at least part of the p53 transactivation domain cc (amino acids 1-74) deleted and replaced by the transactivating domain cc (TD) from herpes simplex virus viral protein VP16 (amino acids 411-490) cc or by a protein domain able to bind selectively to a transactivator, cc especially a single-chain antibody variable domain (ScFv). The present cc and comprising a ScFv domain, amino acids 75-325 of human wild-type p53 and a leucine zipper domain at the C-terminal. The p53 variants are more active and more stable tumour suppressors and apoptosis-inducing agents come in wild-type p53 and are active where the wild-type protein is not, i.e. they are not inactivated by domainant negative or oncogenic mutants, cc nor by other cellular proteins (because the leucine zipper domain compressors)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claimed variants of protein p53 have at least part of the oligomerisation CC domain deleted and replaced by a leucine zipper domain. The mutants CC preferably also have at least part of the p53 transactivation domain CC (amino acids 1-74) deleted and replaced by the transactivating domain CC (TD) from herpes simplex virus viral protein VP16 (amino acids 411-490) CC or by a protein domain able to bind selectively to a transactivator, CC especially a single-chain antibody variable domain (SCPV). The present CC sequence is that of a specifically claimed p53 variant designated S-325H CC and comprising a SCFV domain, amino acids 75-325 of human wild-type p53 CC (but with Arg182 replaced by His) and a leucine zipper domain at the C-terminal. The p53 variants are more active and more stable tumour CC suppressors and apoptosis-inducing agents than wild-type p53 and are active where the wild-type protein is not, i.e. they are not inactivated CC by dominant negative or oncogenic mutants, nor by other cellular proteins CC chashes the leucine zipper domain prevents formation of inactive mixed CC because the leucine zipper domain prevents formation of specification and control of the protein control of the prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

             anti-tumour immunity, to elicit an increased immune response to tumour CC associated antigen (TAA) and/or to induce an immune response to tumour CC wild-type forms of TAA in mammals. (A) is: (i) a monoclonal antibody CC (MAD) to TAA, or its fragment; (ii) a peptide based on a CDR (CC (Complementarity determining region) on the heavy or light chain of MAD (CC (able to elicit antibodies to TAA); or (iii) a DNA that encodes the CC variable (V) region of MAD, in a gene delivery vehicle. The present CC sequence represents the variable heavy chain sequence from anti-p53 MAD (C) antibodies (Ab) by immunising a mammal with a MAD directed to a method for generating sequence-specific, anti-CC domain containing a DNA-binding site of a DNA-binding protein. (A) is CC used to treat a wide variety of primary and metastatic cancers, CC particularly those where p53 is involved. Ab are used for diagnosis (e.g. to determine critical sequences in animal or plant breeding); to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     murine monoclonal antibody 2A2. 2A2 is a neutralizing antibody which is directed against cathepsin B. The antibody is useful for treating and diagnosing a disease associated with an increased cathepsin B activity, such as cancer or arthritis. The antibody is also useful for manufacturing a medicament for treating or diagnosing these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 119 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Best Local Similarity Matches 101; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cryptococcosis; sporothrychosis; blastomycosis; histoplasmosis; tuberculosis; mycobacteriosis; respiratory infection; scarlet figurumonia; impetigo; rheumatic fever; sepsis; septicaemia; cutaneous leishmaniasis; visceral leishmaniasis; keratitis; cystic fibrosis; typhoid fever; gastroenteritis; flu; influenza
                      The invention comprises a polypeptide which contains a part of the variable region of an anti-idiotypic antibody which recognizes the idiotope of an antibody specific for a yeast killer toxin. The polypeptide of the invention is useful for the treatment of microbial viral infections, such as: candidosis, aspergillosis, cryptcocccosis, sporothyychosis, blastomycosis, histoplasmosis, thrush, tuberculosis, sporothyychosis, blastomycosis, histoplasmosis, thrush, tuberculosis, mycobacteriosis, respiratory infections, scarlet fever, pneumonia,
                                                                                                                                                                                                                                                                                              New toxin-related polypeptides comprising a fragment of a variable region of an anti-idiotypic antibody which recognizes the idiotope of an antibody specific for a yeast killer toxin, useful for treating microbial or viral infections.

                             This sequence is the heavy chain variable region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenou administration. The conjugate can be used for cancer therapy, selectivel actions the conjugate can be used for in vivo or in vitro

                                                                                                                                                                                                                                                                                                                                                         This sequence is the HuIgG2 Fd chain region of the antibody of the invention. The antibody is an anti-CEA (carcinoembryonic antigen) antibody (806.077 Ab). Host cells or transgenic organisms transformed with DNA encoding the antibody, are used to make the antibody or conjugate. The conjugate is used in a medicament suitable for intravenous administration. The conjugate can be used for cancer therapy, selectively killing tumour cells. The antibody can be used for in vivo or in vitro diagnosis of cancer. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                   This sequence is a used in a method for obtaining a novel gene construct (A) which expresses, in cells of a mammal, a conjugate (B) of a cell-targeting group (I) and a heterologous prodrug-converting enzyme (II), and (B) is directed to leave the cell for selective localisation at a cell surface antigen (Ag) recognised by (I). Delivery of (A) to a target site, then administration of (III) is used for targeted release of cytotoxic drug, specifically for treating cancer but also inflammation such as rheumatoid arthritis. In situ generation of the targeting antibody increases selectivity, reducing side effects at normal tissue. The method is applicable to any antibody-directed enzyme prodrug therapy
                                                                                                                                                                                                                                  Sequence 281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New gene construct expressing conjugate of targetting agent and prodrug-converting enzyme - useful for, e.g. targetted production of cytotoxic drug in vivo, especially for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 16; Page 84-85; 100pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8888888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC antibody that binds EphA2 with a K-off of less than 3 x 10-3 s-1. Also CC described: (1) a pharmaceutical composition comprising a therapeutic CC amount of (I) and a pharmaceutical carrier; (2) a cell line that produces CC (I); (3) a hybridoma deposited with the ATCC accession number PTA-4572, CC PTA-4573 or PTA-4574; (4) an isolated nucleic acid comprising a CC chain variable domain of the EphA2 antibody; (5) a vector comprising the CC nucleic acid described above; (6) a host cell comprising the vector; (7) CC that inhibits a cancer cell phenotype, that kills cancer cells having a CC exposed on cancer cells; and (8) a method of diagnosing, prognosing or CC exposed on cancer cells; and (8) a method of diagnosing, prognosing or CC suspected to have cancer. (1) has cytostatic, antiasthmatic, antipsoriatic, antinflammatory, vasotropic and respiratory activities, CC and can be used in gene therapy. The composition and methods are useful compassing, diagnosing, preventing or treating hyperproliferative cell diseases or disorders, such as asthma, psoriasis, inflammatory bowel cor monitoring the efficacy of therapy for cancer in a patient known to consessed or chronic obstructive pulmonary disease. They may also be used for monitoring the efficacy of therapy for cancer in a patient known to consuspected to have cancer, and in screening for anti-cancer drugs. The correspondence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method of treating cancer (fully or partially refractory to a first treatment), comprising administering an EphA2 antibody that is an EphA2 agonistic antibody or an exposed EphA2 epitope antibody. The method is useful for treating, managing or preventing cancer (e.g. lung, colon, prostate, breast or skin cancer), particularly metastatic cancer. The method may be used not only in untreated patients but also in the treatment of patients but also in the treatment of patients partially or refractory to current standard and experimental cancer therapies, e.g. chemotherapies or hormonal therapies, to improve the efficacy of such

The polynucleotide or the compound that composition comprising the one or more conjugates or their antibodies. The polynucleotide or the compound that composition comprising a medicament for treating pain (e.g. spinal segmental nerve injury (CNung), chronic constriction conjury (COI) and spared nerve injury (SNI)) in an animal (e.g. gene conjuctivity is useful for proparing a medicament for treating the sequence data for this patent did not form part of the printed confusion, but was obtained in electronic form directly from WIPO at CC fro, wigo. Int. Publy published port sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: Specification, but was obtained in electronic form directly from WIPO at CC fith. Wino introhybriblished references.

Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also lower immunogenicity in humans
                                                                                                                                                        tumour cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 355 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ribonuclease molecules based on native Onconase - used for killing cells, particularly tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 67; 90pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (rOnc) which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
Ribonuclease molecules based particularly tumour cells.
                                                                                                                                                                                                                                                                                                                         Rana pipiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (rOnc) which are modifications of the RNase Onconase (RTW) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (rOnc) which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclesse molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
                                                                                                                                  Ribonuclease molecules based particularly tumour cells.

                                                           Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (ronc) which are modifications of the RNase Onconase (RTM) (nOnc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also
                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 70; 90pp; English.

                           Sequences AAW35125 to AAW35135 represent recombinant fusion proteins (ronc) which are modifications of the RNase Onconase (RTM) (nonc). Such novel ribonuclease molecules are highly cytotoxic and can be used alone or to form chemical conjugates or to target recombinant immunofusions. They are used particularly for decreasing tumour cell growth. They can also be used for cell separation in vitro by selectively killing unwanted types of cells, e.g. in bone marrow prior to transplantation into a patient undergoing marrow ablation by radiation, or for killing leukaemia cells or T-cells that would cause graft versus host disease. The toxins can also be used to selectively kill unwanted cells in culture. The new ribonucleases have increased cytotoxic activity compared to nonc and also

                                                                                                                                                                                    The present sequence represents the mouse monoclonal antibody B9 light chain (B9L), which binds specifically to human blood apolipoprotein B-100. The nucleic acid can be used in a method for the preparation of a reconstituted antibody which specifically binds human plasma apolipoprotein B-100. The antibody can be used as a reagent for determining the concentration of human plasma apolipoprotein B-100 in a sample. The antibody is also useful in a drug composition for selectively removing arteriosclerotic lipoproteins containing human plasma apolipoprotein B-100.
                                                                                                                                                    Sequence 214 AA;
                                                                                                                                                                                                                                                                                                                                 DNA encoding mouse antibody binding human plasma apo-lipoprotein B-100 useful for removing arteriosclerotic lipoprotein(s).
                                                                                                                                                                                                                                                                                                                                                                        N-PSDB;

This sequence represents the sequence for the antibody HNK-20 variable kappa chain. HNK-20 is a murine hybridoma cell line, that produces IgA specific for the F glycoprotein of respiratory syncytial virus (RSV). The DNA encoding these sequences were isolated using primers specific for the 5 untranslated region of the variable region, and for the intron downstream of the rearranged J region (see AAT30459-T30545 for primer sequences). The DNA encoding these sequences can be inserted into vectors containing heterologous (such as sequences can be inserted into vectors containing heterologous (such as suitched antibodies. The antibodies are useful in the treatment and diagnosis of infection by RSV, such as pneumonia and bronchiolitis, in thumans and animals. By using genomic DNA as a template, variable region genes can be isolated without producing fragments that have to be adapted for recombinant antibody expression. Also, by using the genomic DNA, no for recombinant region of the bNA sequence encoding the target variable region is required. Chimeric antibodies produced from these proteins, that contain the constant region of the host being treated, are less likely to cause

This invention describes a novel polypeptide (I), comprising an CC oligopeptide (OP1) having the variable region of the heavy chain (VH) of CC and anti-CA19-9 antibody (Ab), or its fragment with the same binding CC specificity for CA19-9 antigen, and an oligopeptide (OP2) based on the CC variable light chain (VL) region of an Ab, or its fragment, is new OP1 (CC and OP2 are linked, directly or through a linker peptide (LP). The CC and OP2 are linked, directly or through a linker peptide (LP). The CC and OP2 are linked, directly or through a linker peptide (LP). The CC pharmaceutical or diagnostic agent for detection, localization and/or CC pharmaceutical or diagnostic agent for detection, localization and/or CC pharmaceutical or diagnostic agent for detection, localization and/or CC used to produce bi- or multi-specific antibodies, also useful for CC used to produce bi- or multi-specific antibodies, also useful for CC used to produce bi- or multi-specific antibodies, also useful for CC used to produce bi- or multi-specific antibodies, also useful for CC used to produce bi- or multi-specific antibodies, also useful for CC used to produce tis rematured to active form very efficiently after CC internalized by the cells, and has a long residence time on the cell culted for drug targeting, or prodrug activation. Since (I) do not include murine constant regions, it should be possible to administer them CCC when coupled to the human CH2CH3 immunoglobulin domains, they cause appecific lysis of tumor cells. This sequence represents the mouse derived anti-CAl9-9 antibody construct described in the method of the invention vx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New single-chain Fv fragment specific for antigen CA19-9, useful for diagnosis and treatment of tumors, particularly of stomach and pancreas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 6; Fig 1; 23pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   N-PSDB; AAF88024.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2001-345810/37.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                         A method has been developed of depleting CD5+ cells in an animal. The method comprises administering a cytotoxic protein containing a modified immunoglobulin (Ig) variable domain, where the protein is an anti-CD5 Ig molecule or an immunoconjugate or fusion protein containing an anti-CD5 Ig molecule, and where the modified Ig variable domain comprises at least one of (a) a modified light chain variable region (see AAW58478 or AAW58480), and (b) a modified heavy chain variable region (see AAW58479 or AAW58481), where AAW58478 and AAW58479 are humanised forms of the H65 light and heavy chain variable domains with low risk amino acid substitutions [i.e. low risk of reducing antigen-binding specificity.] and AAW58480 and AAW58481 are humanised forms of the H65 light and heavy chain variable domains with moderate risk amino acid substitutions and are present in humanised H65 antibody has (ACC HB 11206). The method is useful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains the method is seeful for treating anticomes of concatally contains and contains which contains and contains which contains anticomes of contains and contains where the contains and contains which 
                                                               useful for treating autoimmune diseases, especially systemic lupus erythematosus, rheumatoid arthritis, psoriasis or type I diabetes. The
